

HONEYWELL SOFTWARE ENGINEERING TEAMS

AI Champions Programme

Module 09

Studio-Style Workflows for Business and Engineering Collaboration

How program and product roles author agent-assisted workflows in Atlassian Rovo Studio — grounded on Jira and Confluence, governed by approval and permission checkpoints, and handed off to engineering without bypassing it.

	DURATION 2 Hours		FORMAT Hands-On Lab		DELIVERED FOR Honeywell Eng. Teams
---	----------------------------	--	-------------------------------	---	--

How We'll Spend These Two Hours

Six connected moves — from where studio workflows sit to one built, tested, and handed off.

01

From Engineering Workflows to Studio Workflows

10 MIN

Where the boundary sits between a studio workflow and an engineering agent.

02

Grounding Agents on Jira & Confluence

15 MIN

Connecting a workflow to issues, design docs, release notes, and engineering status.

03

Anatomy of a Studio Workflow

25 MIN

Triggers, actions and connectors, approval flows, and published output.

04

Human-in-the-Loop & Governance

20 MIN

Collaborating with technical owners without bypassing permissions or review.

05

Versioning & Ownership of Published Workflows

15 MIN

What keeps a live workflow accountable after the person who built it moves on.

06

Hands-On Lab: Build & Hand Off a Studio Workflow

35 MIN

Define, ground, configure, test, and hand off a workflow to technical owners.

Module 09 in the 12-Module Journey

The first module built for program and product roles, not just engineers — the same governance, a different author.

Why this matters: Module 10's Agent Prism observes studio workflows the same way it observes engineering agents; the governance habits from Module 07 and Module 08 apply here too, just authored by a different role.

Where the Boundary Sits

Two layers of the same programme, authored by different roles, meeting at a clear handoff.

STUDIO WORKFLOW	ENGINEERING AGENT
● Authored by program and product roles — no code required ● Triggered by Jira and Confluence events ● Scoped to reporting, triage, and coordination ● Handed to technical owners for engineering implementation	● Configured by engineers, using Copilot and MCP ● Connected to repositories, databases, and test infrastructure ● Scoped to code, tests, PRs, and releases ● Implements what the studio workflow defines

Why this matters: A studio workflow never bypasses engineering governance — it hands off to it. The boundary is a handoff point, not a wall.

Grounding Agents on Jira & Confluence

What a studio workflow actually reads before it drafts anything.

Why this matters: The same governed connections Module 07 built for engineering agents ground studio workflows too — permission-aware access, not a separate back door.

Anatomy of a Studio Workflow

From a Jira event to a published output, with a human checkpoint in between.

The throughline: The approval step isn't optional friction — it's the point where a business user's judgment confirms the agent's draft before anything is published or acted on.

Human-in-the-Loop & Governance

Collaborating with technical owners means never having to find out something broke.

COLLABORATING WITH GOVERNANCE

- Workflows scoped to the business user's own project permissions
- Every published workflow has a named owner and technical reviewer
- Sensitive actions route through an approval checkpoint
- Handoff to engineering is documented, not assumed

BYPASSING GOVERNANCE

- A workflow reaches into data or systems outside the user's permissions
- Published with no owner, no review, no visibility
- Actions execute automatically with no human checkpoint
- Engineering only finds out once something breaks

Versioning & Ownership of Published Workflows

What keeps a live workflow accountable long after the person who built it has moved on.

Version History

Every published workflow keeps a change history — what changed, when, and why.

Named Ownership

One person or team is accountable for a workflow's behavior, not “whoever built it.”

Handoff Documentation

What the workflow does, what it's grounded on, and what it hands off to engineering — written down.

Change Review

Updates to a live workflow go through the same review discipline as the original.

Hands-On Lab Preview: Build & Hand Off a Studio Workflow

The 35-minute activity that closes this module.

**Define the
Workflow**

Program reporting, issue triage, or release coordination — pick one.

**Ground It on
Sample Data**

Connect to the sample Jira project and Confluence space.

**Configure Trigger,
Actions & Approval**

Set what starts it, what it does, and who signs off.

**Test Against
Real Project Data**

Run it against representative issues and documents.

**Hand Off to
Technical Owners**

Document ownership, permissions, and what engineering needs to know.

The throughline: A workflow isn't done when it runs once — it's done when a technical owner can pick it up without guessing.

Module 09 Outcomes & What's Next

- ✓ The boundary between a studio workflow and an engineering agent is understood
- ✓ Grounding a workflow on Jira, Confluence, and connected engineering sources is clear
- ✓ The trigger → actions → approval → output anatomy of a studio workflow is understood
- ✓ Governance practices that keep business users collaborating without bypassing engineering are clear
- ✓ Versioning and ownership requirements for published workflows are understood
- ✓ A studio workflow has been built, tested, and handed off to technical owners

NEXT MODULE

Module 10 — Agent Prism for Monitoring, Observability and Enterprise Control (1.5 hours). Observing the traces, failures, and cost/quality signals from every agent workflow built so far — including the studio workflows just published.

Questions & Discussion

Module 09 — Studio-Style Workflows for Business and Engineering Collaboration
