

HONEYWELL SOFTWARE ENGINEERING TEAMS

AI Champions Programme

Module 12

Honeywell Software Engineering Capstone and Adoption Roadmap

Bringing the complete engineering journey together — spec-driven implementation, test evidence, MCP workflows, PR quality automation, Agent Prism monitoring, and an ROI model — into one use case with a 90-day adoption roadmap.

	DURATION		FORMAT		DELIVERED FOR
	2 Hours		Capstone Workshop		Honeywell Eng. Teams

How We'll Spend These Two Hours

Six connected moves — from what every module contributed to a roadmap someone else could run.

01

The Complete Journey: What Every Module Contributed

15 MIN

A fast recap of what each phase of the programme built toward this moment.

02

The Capstone Deliverable: What You'll Present

20 MIN

The nine required components, and what evidence each one needs.

03

Building the Capstone: Blueprint to Evidence

45 MIN

Hands-on work time to assemble your use case, evidence, and roadmap.

04

Peer & Rubric Review

20 MIN

Walking another team through your capstone, and being walked through theirs.

05

From Capstone to Adoption: The 90-Day Roadmap

15 MIN

Turning one validated use case into a repeatable, governed practice.

06

Programme Wrap-Up & Next Steps

5 MIN

What happens after today, and where to take this from here.

Module 12 in the 12-Module Journey

Every module before this one was building toward a single integrated deliverable — this is where it all comes together.

Why this matters: There's no Module 13. Everything you present in the capstone is graded against the standards set in Modules 01 through 11 — spec quality, test evidence, governance, and ROI.

What Every Phase Contributed

Four phases, each handing the next one something it depends on.

Foundation (Modules 01–03)

AI Champion role clarity, Copilot fluency, and context discipline that keeps token usage predictable.

Build & Validate (Modules 04–08)

A spec-driven feature, built through the full SDLC, tested with Testcontainers, connected via MCP, and reviewed by LLM-as-Judge.

Scale & Govern (Modules 09–11)

A governed studio workflow, an Agent Prism monitoring design, and an ROI model with a defensible governance call.

Capstone (Module 12)

All of the above, integrated into one adoption story with a 90-day rollout plan.

The Capstone Deliverable: Nine Required Components

One software engineering use case, presented with evidence at every stage.

1 Solution Blueprint

2 Specification / Plan

3 Implementation Approach

4 Test Strategy & Evidence

5 MCP Workflow

6 PR / LLM-Judge Evidence

7 Agent Prism Monitoring Design

8 ROI Model

9 90-Day Adoption Roadmap

Evaluation Rubric: What Gets Reviewed

Four questions a peer or reviewer will actually ask.

Traceability

Does every requirement trace to a task, an implementation, and a passing test?

Evidence Quality

Is every claim backed by an actual trace, test run, or PR comment — not just asserted?

Governance Completeness

Are permissions, approvals, and ownership documented for every workflow shown?

Adoption Realism

Is the 90-day roadmap specific enough that someone else could actually execute it?

Hands-On Work Time: Building the Capstone

The 45-minute block where the deliverable actually gets assembled.

**Choose Your
Use Case**

A real greenfield feature or brownfield enhancement from your own work.

**Assemble the
Evidence**

Pull specs, test runs, PR reviews, and traces from what you've already built.

**Build the
Blueprint**

Solution architecture, implementation approach, and governance model in one narrative.

**Draft the
Roadmap**

A specific, executable 90-day adoption plan.

**Present &
Get Reviewed**

Walk a peer and the rubric through the complete story.

The throughline: Nothing in the capstone is new work — it's the story of what you already built, told with evidence.

The 90-Day Adoption Roadmap

From one validated use case to a repeatable, governed practice.

Module 12 Outcomes & Programme Completion

- ✓ Every module's contribution to the capstone is clear
- ✓ The nine required components of the capstone deliverable are identified
- ✓ What the evaluation rubric actually checks for is understood
- ✓ A real use case has been chosen and its evidence assembled
- ✓ A specific, executable 90-day adoption roadmap has been drafted
- ✓ The complete AI Champions journey — Module 01 to Module 12 — has been walked end to end

PROGRAMME COMPLETE

You've walked the full AI Champions journey — from Copilot fundamentals to a governed, measured adoption roadmap. The habits built here are what turn AI-assisted engineering from isolated experimentation into disciplined enterprise practice.

Questions & Discussion

Module 12 — Honeywell Software Engineering Capstone and Adoption Roadmap
